                                                                                                                                                                                                                                                                                The present invention relates to methods for detecting a cancerous colon cell involving detecting at least one differentially expressed gene such as those given in AAL41595-AAL41611. This is useful for diagnosing colon cancer, in rational drug and therapy design, and for identifying additional genes linked to the development or inhibition of development of colon cancer. Examples of colon cancer which can be detected include adenomatous polyp, colorectal carcinoma, high metastatic potential colon tumours and metastatic colon cancer. The present sequence is an antisense sequence directed at a colon cancer associated protein coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                               Detecting a cancerous colon cell, useful for diagnosing colon cancer and for rational drug and therapy design, comprises detecting at least one differentially expressed gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        metastatic colon cancer; antisense; ss.

                                                                                                                                                                         The present invention is related to a Lactococcus lactis nucleotide sequence (ABA90521) and related proteins (ABB53300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese. The present sequence is an oligonucleotide used in an example from the invention. Note: The sequence data for this patent is based on equivalent patent WO200177334 (published 18-OCT-2001) which is available in electronic format directly from WIPO at the production of yogurt and sequence contains the patent would be contained to the patent with the patent would be patent in electronic format directly from WIPO at the patent would be contained by the patent with the patent with the patent would be contained by the patent with the patent 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (I) overcomes the problems associated with the current blue screen technology such as plasmid instability due to vector-driven transcription of the insert DNA. The system addresse this problem by eliminating promoter elements near cloning sites, and providing termination after selectable markers. CC positioned so binding of a repressor to an operator represser and controlled to transcription from the fusion promoters, a method of identifying genes cinvolved in cellular proliferation or required for proliferation of a compound the proliferation of a prokaryotic cell using the vector, a method of identifying compounds that cinhibit the proliferation of a prokaryotic cell using the vector, a method of identifying a compound that reduces the activity or level of a compound identified by the methods, a method of inhibiting the vector, a compound identified by the methods, a method of inhibiting the activity or level of a compound identifying an antibiotic comprising using the vector or cell corexpression of a gene in an operon required for proliferation using the vector, manufacturing an antibiotic comprising using the vector or cell cardidentifying an include activity for regulating nucleic acid or completide expression, particularly for regulating gene expression in bacteria and for identifying proliferation required genes or molecules with potential antibiotic activity. The modified promoters are also custified by replacing endogenous promoters to coreate cells with specific confidentable genes. The present sequence is a PCR primer used to isolate proliferation affected genes from S. aureus which has been transformed with a vector commitiaing a fusion promoter sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid comprising a fusion promoter comprising at least one promoter that is modified to have altered activity in at least one gram-positive organism, or comprising T5, CP25, P32, P59, P1P2 or PL linked to at least one operator consisting of xyl0, tet0, trp0, malo or lambdac10, where at least one operator is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated nucleic acid comprises bacterial promoters modified to have altered activity in at least one gram-positive organism, e.g. Bacillus anthracis or Clostridium botulinum, useful for regulating gene express:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Synthetic

The invention provides the GRACE (gene replacement and conditional expression) method for the construction of mutant organisms referred to as GRACE strains of the organism. The invention can be applied to any organism, particularly a pathogenic fungus e.g. Candida albicans, Aspergillus fumigatus and Cryptococcus neoformans. The methods are useful to identify agents that may be used in the treatment of fungal infections. AAS2387-AAS23747 represent primers A #1-61 used as probes for identifying C. albicans GRACE strains

This invention relates to human cGMP-inhibited phosphodiesterase 17

+ 1 vector components are non-contiguous within the circular recombinant vector. The system comprises X + 1 vector, where = 1, 2, 3, 4, 5 or 6. Also described is a composition comprising X + 1 vector components configured for combining in the presence of X + 1 insert sequences to form a circular recombinant vector, where the X + 1 vector components are non-contiguous within the circular recombinant vector. (I), a composition and kits from the present invention are useful for cloning and sequencing insert nucleic acid sequences. In particular, they are useful for multiplex cloning, multiplex sequencing and fixed orientation cloning.

comprising at least two separate source nucleic acid molecules for supplying X + 1 vector components configured for combining in the presence of X + 1 insert sequences to form a circular vector, when

The present invention describes a system

(I) for cloning nucleic

where the

Included in the invention are a vector containing the nucleotide sequence, a host cell transformed with the vector and an antibody directed against the phosphodissterase 17 protein. The protein, nucleotide sequence and antibody can be used in the treatment or diagnosis of malignant tumours, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammatory disorders. Use of the protein, DNA sequence or antibody may result in cytostatic; haemostatic; virucide; immunomodulatory; and antiinflammatory activity. The present sequence represents a PCR primer specific for cDNA encoding human cGMP-inhibited
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Multiplex cloning; cloning vector; vector component; multiplex sequencing; fixed orientation cloning; PCR

                                                                                                                                                             CC acids of determined algal, archaeal, bacterial, fungal and parasitical species with a combination of defined primer pairs. The method can be CC used for producing probes and/or primers for detecting one or more CC related microorganisms e.g. algae, archaea, bacteria, fungi and CC parasites, for universal detection and for specific and ubiquitous CC detection and identification of an algal, archaeal, bacterial, fungal and CC parasitical species, genus, family and group. A nucleic acid (I) obtained CC using the method of the invention can be used for the universal detection of any bacterium, fungus or parasite in a sample and for the detection of CC at least one antimicrobial agent resistance gene or at least one toxin CC detection and for identification of Streptococcus pneumoniae. (I) can be used to design a therapeutic agent which is effective against microbial species or genus or family or phylum or group which can be detected include Abiotrophia adiacens, Bordetella sp., Tenterbacteriance group. Excherichia coli
                                                                            Query Match

                                                                                                                                                                                               Corynebacterium sp.. Enterobacteriaceae group, Escherichia coli, Mycobacteriaceae family, Pseudomonads group, Streptococcus sp., Neisseria gonorrhoeae and Staphylococcus sp. Using DNA based tests provides faster results than substrate specificity tests as results can be determined in an hour and improved accuracy is also achieved. AAH00010 to AAH002304 represent nucleotide sequences and primers/probes which are given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Species specific, genus specific; family specific; probe; detection; identification; algal; archaeal; bacterial; fungal; parasitical; microorganism; diagnosis; translation elongation factor Tu; toxin; translation elongation factor G; RecA recombinase; resistance; catalytic subunit of proton-translocating ATPase; antimicrobial; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nucleic acids of tuf, fus, atpD and/or recA genes from which probes and/or primers are derived. The method comprises amplifying the nucleic acids of determined algal, archaeal, bacterial, fungal and parasitical acids of determined algal, archaeal, bacterial, fungal and parasitical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acid sequences are used to generate universal probes and primers which can be used to identify and detect the presence of algal, archaeal, bacterial, fungal and parasitical species in a test sample.

                                                                                                                                                                                                cc used to demonstrate Bi-PASA. In Bi-PASA, 2 outer primers (P and Q) and 2 cinner primers (A and B) are used. A and B are each specific for different calleles. P is complementary to the antisense strand of both alleles in a region upstream of the sequence difference (mismatch). Q is complementary to the sense strand of both alleles in a region downstream of the complementary crown the sense strand of both alleles in a region downstream of the mismatch. In heterozygotes, 3 segments are amplified: a segment of size Q resulting from 1 allele, another of size PB resulting from the 2nd callele, and a combined segment of size PB. In homozygotes, segment PQ and care given in AAF30550-74. Under optimal PCR conditions, the relative indicated by a weak DNA band on agarose gels. Bi-PASA provides a one-tube method for simultaneously differentiating homozygotes and heterozygotes. It can detect small deletions and insertions as well as single base changes. Bi-PASA is also used to perform population screening, haplotype analysis, patient screening and carrier testing. The method is rapid, crown the stranges of the present of the present of the present of the pase consists, patient screening and carrier testing. The method is rapid, crown the stranges and method is rapid, crown the stranges and method is rapid.

Its name indicates an A primer for FV (F5), the 5' end beginning at base 254 of exon 10 of the FV gene (see AAF30549) and proceeding downstream for 23 bases. It also includes a G10 tail, and the proceeding downstream for 23 bases. It also includes a G10 the FV gene is a mutated A nucleotide. A mutation in exon 10 of the FV gene is associated with venous thromboembolism. Detection of this mutation was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Conducting a bi-directional polymerase chain reaction amplification of specific alleles, involves amplifying DNA containing one or both of two alleles using an outer pair of primers and an inner pair of primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               US6207425-B1

                                                                                                                                                                                                The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the genes, CC their use in the discovery of novel antiblotics, the essential genes CC themselves and the encoded proteins. The prokaryotes used are Escherichia CC coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, CC pseudomonas aeruginosa and Enterococcus faecalis. The invention is also CC useful for the identification of potential new targets for antibiotic CC development. The antisense nucleic acids can also be used to identify CC proteins used in proliferation, to express these proteins. and to obtain CC antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The can useful to screen compounds in rational drug discovery programmes. The can collect acids sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence is a PCR primer used to isolate an CC seguence data for this patent did not form part of the printed consequence and the consequence of the invention. Note: The consequence data for this patent did not form part of the printed consequence is obtained in electronic format directly from WIPO

Firefly luciferase catalyses the oxidation of luciferin with the resultant production of light. Luciferases (both wild type and recombinant) lose activity quite rapidly when exposed to temperatures in excess of 30 degrees celsius. The present invention relates to luciferase enzymes comprising specific mutation which increase its thermostability. Also included in the invention are: 1) a vector comprising a nucleotide sequence encoding the mutant luciferase; 2) a cell transformed with the vector and, 3) a plant comprising the transformed cells; The luciferase enzyme is useful in bioluminescent assays, where it uses the substrate D-luciferin (4,5-dihydro-2-(6-hydroxy-2-benzothiazolyl)-4-thiazole
AAA75311-41 and AAA75393-A75402 are derived from the origin of replication of the pBR322 plasmid. The nucleic acid fragments are useful as probes and primers for detecting sequences derived from the origin of replication of pBR322 or vectors (or their fragments) that contain such
                                                                                                               Nucleic acid sequences that hybridize to the pBR322 origin of replication, useful for monitoring gene therapy vectors, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mutant luciferase enzyme comprising specific mutations which increase thermostability, useful in bioluminescent assays.

                                                                                                                 The present invention relates to a method for the locus-specific, separate amplification of exon 2, exon 3, and/or exon 4 of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles. The method is useful for subtyping or typing of HLA class 1 alleles. The present sequence is an amplification primer used in the method
                                                                                                                                                                                                                   Locus-specific, separate amplification of exon 2, exon 3, and/or ex of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles using d primer sets, useful for subtyping or typing of HLA Class I alleles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sequences. They are particularly used to monitor the presence of gene therapy vectors (used to deliver therapeutic genes or proteins, antise sequences or ribozymes), e.g. for determining disappearance of the vector, for adjustment of treatment, or for timing of new treatments. They can also be used to screen foods and cosmetics for the presence derived materials from genetically modified organisms
                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                            09-APR-1999;

assays more meaningful by the addition of internal control agents.

Primers for a target and an internal control sequence are labelled with a detectable marker which allows concurrent detection and measurement of target and control nucleic acid amplification. The reaction may also contain a non-extendable oligonucleotide (i.e. a blocking sequence) complementary to the internal control sequence, which functions as a negative control. The method can be used for quantitating nucleic acid amplification of control DNA in the presence of, and concurrently with, nucleic acid amplification of known or unknown target DNA. Suggested uses include tracking of target sample extraction, isolation and purification of for complements ample extraction, isolation and purification of polymorphic samples or pathogen detection. Primers AAZ40585-Z40587 are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Method of conducting nucleic acid amplification control reactions used for e.g. carrying out real time monitoring of nucleic acid amplification reactions and positive and negative control tests.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Reporter; quencher; probe; assay; internal control agent; primer; PCR; detection; measurement; amplification; blocking sequence; copy-number; quantitation; allele; discrimination; polymorphism; pathogen; NPTII; s

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Firefly luciferase catalyses the oxidation of luciferin with the resultant production of light. Luciferases (both wild type and recombinant) lose activity quite rapidly when exposed to temperatures in excess of 30 degrees celsius. The present invention relates to luciferase enzymes comprising specific mutation which increase its thermostability. Also included in the invention are: 1) a vector comprising a nucleotide sequence encoding the mutant luciferase; 2) a vector and, 3) a plant comprising the transformed with the vector and, 3) a plant comprising the transformed cells; The luciferase enzyme is useful in bioluminescent assays, where it uses the substrate D-luciferin (4,5-dihydro-2-(6-hydroxy-2-benzothiazoly1)-4-thiazole
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 23 BP; 2 A; 8 C; 12 G; 1 T; 0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a PCR primer used in the preparation of a thermostable mutant luciferase enzyme from Photinus pyralis (firefly).
                                                                                                                                                                                                                                                                                                   AAA53356;

The chimeric polynucleotide contains both RNA and DNA residues in the first strand and solely DNA residues in the second strand; wherein the strands are Watson-crick paired and are linked by an oligonucleotide be trands are Watson-crick paired and are single 3' and 5' end. The ribo-deoxynucleic acids can be used for specifically introducing alterations into a target nucleic acid. They can be used for e.g. the production of transgenic animals. The present sequence represents a control vector used along with a chimeric vector which was constructed to direct a mutation in the NIH 3T3 cells. The transformation of the NIH 3T3 cells results in selectable alteration in
            library targeted to a selected RNA transcript. The methods can be used for identifying antisenne agents and for identifying target sites for antisense-mediated inhibition of a selected gree. The use of a direct library for target site selection significantly simplifies the screening process, since only very small libraries need be prepared and assayed. AAZ23765-Z23767 represent multiple cloning site DNA regions used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
                                                                                                              Oligonucleotides AAX15540-46 are used in the course of the invention. specification describes a cellulase enzyme designated SCE-3. The cellulase is used in the methods of the invention for treatment of containing fibres, for bleaching denim-dyed cellulose-containing fibres, for eliminating fluffs from cellulose-containing fibres, for weight loss treatment of cellulose-containing fibres, for weight loss treatment of cellulose-containing fibres and deacetylated triacetate rayon, all by contacting the preparation with such fibres. It is useful in the textile and related industries
                                                                                                                                                                                                                                                   Cellulose preparation containing highly active cellulase SCE3 - e. treating cellulose-containing fibres to enable fluff elimination, loss and bleaching, and in weight loss treatment of deacetylated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                 S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a primer used in the method of the invention for the detection of the presence or absence of chromosomal abnormalities, and can abnormalities, the detection of the presence or absence of chromosomal abnormalities, and cach abnormality being associated with a condition in a subject and each being defined by at least one characteristic nucleic acid sequence. The method comprises: (a) obtaining a sample of nucleic acids derived from a subject which may harbour one of the chromosomal abnormalities; (b) subjecting the sample to a multiplex molecular amplification (MMA) procedure, where a number of the characteristic sequences, if present in a sufficient amount, will be amplified; (c) retrieving the product(s) from step (b), and detecting the presence and/or absence of an amplicon characteristic of the abnormal sequences to detect the presence or absence of corresponding chromosomal abnormalities; where the MMA procedure comprises the use of at least 7 mutually distinct primers (MDP) in one single reaction mixture, each of the primers defining an end of at least one characteristic nucleic acid sequence, and where at least one of the primers defines the first end of at least two characteristic nucleic acid sequences each being determined in their opposite ends by MDP selected from the remainder of the MDP. The methods can be used for detecting chromosomal abnormalities associated with diseases including numerous leukaemia's, lymphoma's, adenocarcinoma's, sarcoma's, clioma's, nurrhlara's,
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches 18;

Such complexes are used to introduce a predetermined alteration in a target sequence of the genome of a cultured cell containing a nucleus and to obtain cells with altered characteristics. The nucleic acids permit easy alteration of an existing

                                                                                                                                                                                                                                                                                                                           The sequences given in AAQ87854-69 are probes which were used in the Ci isolation of the component B gene. The probes are targetted to various Cregions of the gene including the promoter, the three exons and intron 2. These probes were used to screen a human genomic library. The component B gene contains three exons and two introns. Exon 1 is 84 bp and contains CC 26 bases of untranslated mRNA. It encodes 19 amino acids of the putative signal peptide and is separated from exon 2 by an intron of 410 bp. Exon CC 2 is 120 bp and codes for 3 amino acids of the putative signal sequence CC and intron of abbout 550 bp. Exon 3 is 326 bp and encodes the C-terminal CC 44 amino acids of component B, and 192 bases of untranslated RNA which CC contains a poly-A signal 14 bp upstream of the 3' processing site. CC component B is a low molecular weight protein which may be isolated from CC solatum hydroxide. It inhibits binding of TGF-alpha to its receptor, and contains antiinflammatory, anticoagulant and/or antitumour activities. It can also be used to treat conditions associated with altered levels of TGF-alpha, eg. behavioural or hormonal disturbances and angiogenesis. See CC can also AAQ87876-78. (Updated on 25-MAR-2003 to correct PN field.) (Updated CC on 75-MAR-2007 to correct PN field.)

A specific application is diagnosis of copper toxicosis (CT). The inventior can also be used to create a genetic map of the canine genome; to generate breed-specific profiles; to establish paternity and to identify dogs from DNA fingerprints. The method provides rapid analysis of the target sequences from only a small sample of DNA. Diagnosis can be done at any time in the dog's life. The present sequence is that of a PCR primer of the invention.

The method may be used for early diagnosis of cancer. Binding of MBP to single strands is inhibited by the single strand binding protein. By activating MBP with an activator, before addition to the sample, binding to double strands lacking

                                              This sequence represents a PCR primer for a proto-oncogene/oncogene, and CC was used to test the method of the invention. The method is for CC increasing synthesis of nucleic acid (I) in a cell by exposing it to CC ultrasound, where (I) is: (a) an endogenous sequence (Ia) encoding a CC stress or repair protein; or (b) an introduced exogenous sequence (Ib). CC The method is specifically used therapeurically: (i) to treat CC phenylketonuria (following introduction of [Ib) for phenylateonyria (following introduction of (Ib) for phenylalanine CC iii) to increase production of IL-2, particularly associated with CC (iii) to increase production of IL-3, particularly associated with CC (iii) to increase production of IL-3, particularly associated with CC (iii) to may include one or treating cancer by administering a CC sequence antisense to initiation factor 3 and/or tRNA synthase. More CC complete chromosomes, for delivery (in vivo, in vitro or even CC complete chromosomes, for delivery (in vivo, in vitro or expension), e.g. acquired immune deficiency syndrome, aucoimmune diseases, chronic viral cinfections, haemophilia, cystic fibrosis, and cancer. Ultrasonic viral CC carticularly of 4-6 kb

WPI; 1999-197823/17.

An antisense nucleic acid compound against vascular endothelial cell growth factor (VEGF) - useful as an anticancer agent, and for treatm of rheumatic arthritis and diabetic retinitis. and for treatment

Page 7; 16pp; English.

AAX15764-81 represent antisense oligonucleotides targeted to the upstream sequence of the coding region for vascular endothelial cell growth factor (VEGF). Antisense oligonucleotides targeted to this region inhibit at

                                                                                                                                                                                                                                                                                                                                                                                                                     cc consensus sequence is a primer for a human or mammalian DNA replication origin consensus sequences of the invention, designated alphaconsensus. Cc Administration of the consensus sequence or an anti-gene (comprising a double stranded copy of the consensus) is used to inhibit DNA replication in vivo or in vitro. The consensus sequences can also be inserted into an cexpression vector, used subsequently for in vitro transfection of cc mammalian cells, to control initiation of DNA replication. They can also be used used to maintain circular plasmids that are capable of semi-cc conservative replication in proliferating mammalian cells, or inserted into mammalian or human artificial chromosome vectors for gene therapy. Particularly, they are used to create shuttle vector constructs for chromosomal function. The consensus sequence can be combined with cloned chuman telomeres and large centromeric blocks for assembly of human or artificial chromosomes and maintained as bacterial plasmids, circular or linear, large or small yeast artificial chromosomes (YACs) or as episomal
                                                                                                                                                                                                                                                                                                                   Query Match

The method is for for detecting a mutation from a non-mutated sequence of a target polynucleotide (TP) in a sample, by using a mismatch binding protein (MBP), comprises: (a) providing a non-mutated and mutated TP; (b) forming duplex of the non-mutated and mutated TP; (b) forming duplex of the non-mutated and protein to the polynucleotide from (a); (c) adding a single strand binding protein to the polynucleotide from (b); (d) incubating MBP with an activating agent; (e) adding the incubated MBP from (d) to the polynucleotide from (c), so that MBP binds to the duplex formed by one non-mutated and one mutated single strand of TP; and (f) detecting the presence of any MBP bound to TP. The method may be used for early diagnosis of cancer. Binding of MBP to single strands is inhibited by the single strand binding protein. By activating MBP with an activator, before addition to the sample, binding to double strands lacking
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          :

                                                                                                                                                                                                                                                                                                                        CC A new method has been produced for the detection of an activated ras gene CC containing a mutated codon. The method involves: either cleaving a human CC subject's genomic DNA with a restriction enzyme to produce DNA fragments CC and treating the fragments to obtain single-stranded DNA molecules or cisolating the subject's polyA+ mRNA; contacting the single-stranded DNA CC molecules or polyA+ mRNA under hybridising conditions with a labelled CC synthetic DNA molecule, optionally bound to a solid support, comprising CC 12-20 nucleotides, where the synthetic DNA molecule is 5'-B-Q-D-3' in the CC case of single-stranded DNA or is complementary to 5'-B-Q-D-3' in the CC case of polyA+ mRNA, B = 0-9 nucleotides having a sequence complementary to a sequence in the activated ras gene 5' of the mutated codon, D = 0-12 cm cleotides having a sequence complementary to a sequence in the activated ras gene 5' of the mutated codon, D = 0-12 cm cleotides having a sequence complementary to a sequence in the activated ras gene 3' of the mutated codon, provided that B and D contain CC atotal of at least 9 nucleotides, and Q is complementary to the mutated codon; treating the resulting hybridised molecules under conditions CC permitting only fully complementary molecules under conditions of the underted only fully complementary molecules to remain hybridised; and CC permitting fully fully complementary molecules to remain hybridised; and CC permi
                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                               C. AAX09121-X10268 are allele-specific oligonucleotide primers used in the isolation of various biallelic polymorphic markers found in the human C genome (represented in AAX10269-X12937). These primers can be used in a comethod for determining polymorphic forms in an individual for use in e.g. C forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular C dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial C hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary c spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary cautoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, c endurance, fertility, and susceptibility or receptivity to particular c drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or c prophylaxis of such diseases
                                                                                                                                                                                                                                                Matches

Microsatellite markers based on hypervariable genomic fragments, from CC Triticum aestivum (wheat) or the tribe Triticeae, consist of a sequence cc tagged site (STS), defined by 2 specific primers (of mean size 17-23 bases) that flank a microsatellite sequence at both ends, which can be cc amplified to polymorphisms (PCR products of different sizes). The CC microsatellites are n-fold tandem repeats (n = 10 or more) of di-, tri- or tetra-nucleotide sequences, combination microsatellite sequences or an imperfect sequence in which individual bases are mutated. The microsatellite markers can be used for genetic analysis of hexaploid and ctetraploid forms of wheat and for genetic mapping or labelling of compogenic and polygenic properties, and for their selection; for analysing relationships and identifying varieties; and for evaluating cc analysing relationships and identifying varieties; and show a higher cd differentiate between almost all European wheat lines and show a higher can be detected by PCR, so large numbers of samples can be analysed casily (e.g. several hundred per day). Microsatellite marker-related cc polymorphisms are stably inherited so can also serve as genetic markers.

AAT77003-22 and AAT77535-716 are primer pairs that define the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

They may also be used to elucidate mechanisms of growth inhibition and apoptosis. Introduction of the second (upstream) ClaI site greatly reduces the chance of producing undigested DNA genome and increases the chance of generating fully cut DNA (i.e. redn. of parental genomic background). The vectors can be produced without the use of a plasmid-based vector, and infect breast cancer cells far more efficiently than bone marrow cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Microsatellite marker; hypervariable genomic fragment; Triticum ae wheat; Triticeae; sequence tagged site; STS; primer; PCR; amplify; polymorphism; genetic analysis; hexaploid; tetraploid; mapping; ss

                                                                                                                     Primer pairs UGT184f (AAT73571) and UGT184r (AAT73572), UGT197f (AAT73573) and UGT197r (AAT73573) and UGT184r (AAT73575) and UGT1r2 (AAT73575) were used to amplify sequence-tagged sites (STS) from Pennisetum genomic DNA. The primers were designed from sequences cloned from a BC3 clonal line K169-46 library. The STS can be used as molecular markers for the identification of Pennisetum apomixis genes. Such genes, esp. from Pennisetum aquamulatum, can be transferred to pearl millet to provide apomictic plants useful as forage or grain cultivars or for development of true- breeding hybrids
                                                                                                                                                                                                                                                                         Transgenic apomictic plants, e.g. pearl millet, expressing Pennisetum squamulatum apomixis gene(s) - useful as forage or grain cultivar(s) to develop true-breeding hybrids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Apomixis gene; true-breeding; pearl millet; molecular marker; probe; hybrid seed; transgenic plant; Pennisetum squamulatum; sequence stagged site; STS; polymerase chain reaction; PCR; primer; ss

Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. The primers T41293-4 amplify clone pm2780 which comprises the GS HUMGS000976 (T19976), located on chromosomes 14 and 16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Single-stranded DNA for identifying gene signatures - isolated from 3'-directed human cDNA library that reflects relative abundance of corresp. mRNA in specific human tissues.
                                        Kit for automated genotyping contg. pairs of PCR primers - de amplify polymorphic nucleotide repeat sequences, arranged in with a characteristic fluorescence label, useful e.g. in deta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primers T41001-T41382 are derived from novel human gene signature (GS) sequences which did not match with sequences deposited in Genbank releas. 76. The GS sequences (T19001-T26837) were obtained from 3'-directed cDNA
                                                                                                                                                                                                                                                                                                                                                       primer; polymerase chain reaction;

Disclosure; Fig 7F-2; 104pp; English

AAT33529-30 are primers used to determine the absence of adenovirus Ela nucleotide sequences in an adenoviral (Adv) vector encoding for the expression of human wild-type p53 protein (AdWTp53). New Adenoviral (Adv vectors comprise: (i) an origin of replication; (ii) a left inverted terminal repeat; (iii) a nucleotide sequence of the AdV genome contg. 2 ClaI sites, one at the 5'-end; and (iv) a homologous recombination domain. Adv vectors which also contain heterologous DNA and regulatory sequences, are used to inhibit cell proliferation (including abnormal vascularisation), esp. to treat human melanoma, breast or lung tumours, sarcoma and carcinoma, including forms resistant to drugs. The vectors are also used to treat subjects at risk of such cancers, and to purge

(AdV)

Adeno:viral vector for gene therapy of cancer or bone marrow purging contains two ClaI restriction sites to increase chance of generating fully cut DNA, thus reducing the parental genomic background.

polymorphic, simple sequence repeats and can be used in automated genotyping. esp. fluorescence-based. The primers correspond to the unique DNA sequence surrounding each marker, and PCR is used to detect each polymorphism. When the MMS show considerable polymorphism (ie. a difference in the number of repeats) between individuals, the markers can be particularly informative. The MMS can be ideal for linkage studies. Kits comprise at least 4 groups, of at least 3 sets, each comprising labelled primers for PCR amplification of the DNA. Group 6 primer pairs are shown in AAQ95639-686. The published size range of the DSS413 allele is 264-276 bp, and the degree of heterozygosity in the population is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 probes were synthesised based on single point mutations at codon 49. After PCR amplification of nucleic acid samples using specific primer pairs, these probes can be used to detect Gs(alpha) mutations associated with oncogenesis. See AAQ13431-Q13542. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                            Total mRNA, is extracted from the seeds, leaves and roots of pokeweed and used to prepare cDNA using PCR. The resultant cDNA is used to prepare two DNA fractions, which are introduced into a cloning vector EMBL3 and then into host E.coli PLK-17 (P2) to produce PAP. PAP has a similar activity to ricin, i.e. inhibits protein synthesis. The protein may be obtained all year round by recombinant DNA techniques. PAP can be used partic.

Detection is carried out by hybridisation of denatured (ss) sample DNA with a (ss) nucleic acid probe, complementary to the target sequence. Hybridisation occurs or the surface of an electrode or optical fibre and detection is visualised by the addition of an entity that recognises (ds) hybridised DNA and is electrochemically / photochemically active
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gene signature; messenger RNA; mRNA; relative abundance; frequency; human; cloning; mapping; non-biased library; diagnosis; detection; cell typing; abnormal cell function; primer; PCR; amplification;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detection method of gene without using radio-isotope - by hybridi of nucleic acid probe which is single strand having complementary sequence of gene and single strand denatured sample DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gene detection; radio-isotopes; target gene; electrode; detection; optical fibre; hybridise; hybridisation; electrochemical; photoche electrolysis; probe; ss.

CC sequence encoding a polypeptide which has an amino accid sequence of a coursesponding to position 715 of the wild-type voltage-gated chloride channel CIC-2, where the glyvine (Gly) residue CC channel CIC-2 comprising a 898 amino acid sequence of SEQ ID NO:2, is constant of the course of the voltage-gated chloride CC channel CIC-2 is encoded by the CLCN2 gene. The voltage-gated chloride CC channel CIC-2 is encoded by the CLCN2 gene. The voltage-gated chloride course comprising (I); (2) a host transformed with the vector of (I) or CC transformed with (I); (3) a method of producing the polypeptide encoded by (I); (4) a polypeptide encoded by (I) produced by the method of (3); (Cl) an antibody specifically reacts with an epitope generated and/or formed CC by the mutation in the voltage-gated chloride channel CIC-2; (6) an antibody specifically reacts with an epitope generated and/or formed CC aptamer specifically binding to (I) or to the polypeptide of (4); where cC the antibody of (5), the aptamer of (6) and the polypeptide of (4); (7) a CC composition comprising (I), the vector of (I), the polypeptide of (4); (7) a CC composition comprising (I); (II) a method of treating a neurological disease or a composition comprising (I); (II) a method of treating an envirological composition comprising (I); (II) a method of treating an envirological composition for molecules capable of specifically and the primer or pair of primers of (3); the aptamer of (5), the aptamer of (6) and the primer or pair of primers of (7); (1) a method of treating an envirological composition of the comprising (I); (II) a method of treating an envirological composition for molecules capable of specifically interacting with the composition of the composition (I); and the polypeptide of (4); the antibody of (5), the aptamer of (6) and the primers of (6) and the pr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches 16;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      interference by detecting the regions in the DNA sequence fulfilling the following requirements such as: (i) the base at 3' terminal is adenine, thymine or uracil], (ii) the base at 5' terminal is guanine or cytosine; (iii) the seven base sequence at 3' terminal is rich in adenine, thymine and uracil, and; (iv) there are bases in a such a number that it causes RNA interference without showing cytotoxicity. The method is used for designing and synthesizing sirNA causing RNA interference. This sequence corresponds to an RNA interference target sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting sequence of RNA interference useful for synthesizing siRNA, detecting regions in sequence fulfilling specific criteria such as bar at 3' terminal is adenine, thymine or uracil, base at 5' terminal is

The method involves determining the amount of expression of an interferon-associated gene in cancer cells or virus-infected cells. The invention also relates to drug compositions for the treatment of cancer and viral diseases containing interferon-alpha together with a cyclooxygenase-2 (cox-2) inhibitor such as indomethacin which potentiates the apoptosis induction effect of the interferon. The method and compositions of the invention are useful in the treatment and prevention of cancers (e.g., cancer of the colon, lung, pancreas, breast, stomach, liver, kidney, nerve cell, skin, muscle, uterus and throat) and viral infections (e.g., hepatitis B and C). The present sequence represents a PCR primer used in real-time PCR to determine the amount of expresents a PCR primer used in real-time presents and contained in the presents of interferon-associated gene in cancer cells cultured in the presence of interferon-alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  for estimating the therapeutic effect of viral disease.

The composition has cytostatic activity, and can be used in gene therapy. The composition is useful in treating cancer, e.g., prostate, bladder, lung, breast, pancreatic, colon, skin (for example melanoma), renal or ovarian cancer or a central nervous system mallignancy. The present sequence represents a human hsp27 short interfering RNA (siRNA) oligonucleotide which is used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                           deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the TGFb-R gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating diabetic nephropathy, chronic liver disease or pulmonary fibrosis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TGFb-R-targeted double-stranded siNA, which is identical to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human transforming growth factor beta (TGFb) receptor (TGFb-R) gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New short interfering nucleic acid, useful e.g. for treatment and diagnosis of diabetic nephropathy, which downregulates expression of transforming growth factor-beta receptor gene.
                                                                                                                                                                                                                                   Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 pharmacogenomics; gene function analysis; gene mapping; human;

The invention relates to short interfering nucleic acids (SiNA) which CC downregulate expression of the human tumour necrosis factor (TNF) CC receptor gene by RNA interference. The siNAs may not comprise CC ribonucleotides and may be double or single stranded. They further CC asense oligonucleotide and antisense regions, or alternatively are assembled from CC asense oligonucleotide and an antisense oligonucleotide. Specifically, CC unmodified or chemically modified, can contain deoxyribonucleotides, and CC can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in CC vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the TNF receptor gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a CC variety of conditions. The TNF receptor siNAs have antibacterial, CC and antihlammatory activities. They may be used for treating septic conditions, therapeutic target identification and validation, genetic Shock, rheumatoid arthritis, HIV/AIDS, psoriasis, inflammation and cautoimmune diseases. The siNAs are also useful for drug screening, CC diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence of a transpland siNA

further comprise sense and antisense regions, or alternatively are casembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs cc can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the TGFD-R gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating clabetic nephropathy, chronic liver disease or pulmonary fibrosis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TGFb-R-targeted double-stranded siNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 11-MAR-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homelogue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              pharmacogenomics; gene function analysis; gene mapping; tumour necrosis factor receptor; TNF receptor; human; DNA-RNA hybrid; ss; tumour necrosis factor receptor; TNF receptor; human; DNA-RNA hybrid; ss; antibacterial; immunosuppressive; antirheumatic; antiarthritis; antipporiatic; antiinflammatory; septic shock; rheumatoid arthritis; HIV/AIDS; psoriasis; inflammation; autoimmune disease; target sequence.

Cribonucleotides and may be double or single stranded. They further CC comprise sense and antisense regions, or alternatively are assembled from CC a sense oligonucleotide and an antisense oligonucleotide. Specifically, CC the sinAs include short interfering RNA (siRNA), double-stranded RNA, CC micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be CC unmodified or chemically modified, can contain deoxyribonucleotides, and CC can be chemically synthesised, expressed from a vector or enzymatically conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the TNF receptor gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a CC wariety of conditions. The TNF receptor siNAs have antibacterial, CC immunosuppressive, antitheumatic, antiarthritic, anti-HIV, antipsoriatic cand antiinflammatory activities. They may be used for treating septic complexes, therapeutic target identification and validation, genetic cengineering, pharmacogenomics, studying gene function, and gene mapping CC engineering, pharmacogenomics, studying gene function, and gene mapping CC engineering, which is identical to the TNF receptor transcript target could be accompleted siNA, which is identical to the TNF receptor transcript target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human tumour necrosis factor (TNF) receptor gene by RNA interference. The siNAs may or may not comprise

The invention further relates to: an oligonucleotide containing single nucleotide copymorphisms; a PCR primer set chosen from the combination of two DNA CR fragments from any one of 1220 fully defined sequences as given in CR specification; a labelling probe containing the SNP containing oligo; and CR a microarray equipped with the SNP containing oligo. The isolated human gene of the invention is useful for detecting the single nucleotide copymorphisms in human gene. The isolated human gene is also useful for tisolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene effective in detecting single nucleotide cone of the PCR primers used in the single nucleotide sequence represents the polymorphism of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  В

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        nucleic acid (sinh) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The sinkh of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ABL1-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antiasthmatic, immunosuppressive, antibacterial, antirheumatic, antiprocessive, antipacterial, antirheumatic, antiprocession of maps activities. The MAPK sinks can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types I and II; a wide range of tumours, and inflammatory diseases (asthma, septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents a MAPK sink which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                  short interfering nucleic acid; siNA; downregulation; inhibition; mitogen-activated protein kinase; MAP kinase; MAPK; RNA interference; cytostatic; anorectic; antidiabetic; antiinflammatory; antiasthmatic;

                                                                                                      antiasthmatic, immunosuppressive, antibacterial, antirheumatic, antipscriatic and gastrointestinal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types I and II, a wide range of tumours, and inflammatory diseases (asthma, septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents a MAPK siNA which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             20-FEB-2002;

                                                                                                                                                                                                                                                                                                                                    The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of a mitogen-activated protein kinase (MAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA and cells containing these vectors. MAPK siNAs between the containing these vectors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 1398
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      that downregulates expression of a mitogen-activated protein kinase (MAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or conganisms by introduction of siNA; (2) kits for in vitro or in vivo (2) delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) (4) (5) vectors that express siNA and cells containing these vectors. MAPK siNAs (6) have cytostatic, anorectic, antidiabetic, antiinflammatory, antiarthratic, immunosuppressive, antibacterial, antirheumatic, antipsoriatic and gastrointestial, antirheumatic, containing these vectors. MAPK siNAs (7) siNAs can be used to modulate the expression of MAPK genes, in cells, (8) crissue explants or organisms, e.g. for treating obesity; diabetes types in crist of timeours, and inflammatory diseases (asthma, 1) cells, and II; a wide range of tumours, and inflammatory diseases (asthma, 1) cells, they can also be used for drug screening; diagnosis; target (1) disease). They can also be used for drug screening; pharmacogenomics; confidentification and validation, genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide colymorphisms). The present sequence represents a MAPK siNA which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

antiasthmatic, immunosuppressive, antibacterial, antirheumatic, antipsoriatic and gastrointestinal activities. The MAPK sinNa can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types and II; a wide range of tumours, and inflammatory diseases (asthma, septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents a MAPK siNA which is use in the exemplification of the present invention.
                                                                                                                                                                                                                                                          that downregulates expression of a mitogen-activated protein kinase (MAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA and cells containing these vectors. MAPK siNAs have cytostatic, anorectic, antidiabetic, antiinflammatory,
                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a short interfering nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA. SCD inhibiting siNAs have anorectic, antidiabetic, antiarteriosclerotic, cytostatic and virucide activities. The siNAs can be used to modulate expression of SCD genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes (types I and II); atherosclerosis; cancer and viral infections. They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD siNA, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         short interfering nucleic acid; siNA; downregulation; inhibition; Stearoyl-CoA desaturase; RNA interference; anorectic; antidiabetic; antiarteriosclerotic; cytostatic; virucide; obesity; diabetes; atherosclerosis; cancer; viral infection; drug screening;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Stearoyl-CoA desaturase siNA oligonucleotide SEQ ID NO:379.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ADE27435;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ADE27435 standard; RNA; 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a short interfering nucleic acid (siN that downregulates expression of the SCD (stearoyl-CoA desaturase) get by RNA interference. Also described: (1) modulating expression of SCD

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes (types I and II); atherosclerosis; cancer and viral infections. They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD sina, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        by RNA interference. Also described: (1) modulating expression of SCD genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA. SCD inhibiting siNAs have anorectic, antidiabetic, antiarteriosclerotic, cytostatic and virucide activities. The siNAs can be used to modulate expression of SCD virucide activities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 19 BP; 3 A; 5 C; 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diagnosis of obesity or diabetes, downregulates expression of stearoyl-CoA desaturase gene.
                                                                                                                                                                                                    20-FEB-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to High Bone Mass (HBM), LRP5 (Zmax1) ar LRP6 mutants, which results in a HBM-like phenotype when expressed in cell. The HBM-like phenotype results in bone mass modulation and/or lilevel modulation. The invention is useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject suffering from e.g. osteoporosis. The present PCR primer was used to illustrate the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to High Bone Mass (HBM), LRP5 (Zmax1) and LRP6 mutants, which results in a HBM-like phenotype when expressed in a cell. The HBM-like phenotype results in bone mass modulation and/or lipid level modulation. The invention is useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject suffering from e.g. osteoporosis. The present sequence is a Sequence Tagged Site (STS) marker, which was used to prepare a physical map of the Zmax1 (LRPS) gene receipts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid comprising a mutation in LRP5 or LRP6, useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antiarteriosclerotic; cytostatic; virucide; obesity; diabetes;
atherosclerosis; cancer; viral infection; drug screening;
                                                                                                                                                                                                                                                                                                                                                                                        13-FEB-2003; 2003WO-US004317

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to novel transgenic animals expressing the high CC bone mass (HBM) gene, expressing the corresponding wild type HBM gene, CC comprising an alteration of the gene encoding LRP5 or LRP6, or expressing CC an LRP5 that is modulated by an altered gene control sequence introduced by homologous or non-homologous recombination. The transgenic animals are CC for the study of bone density modulation or bone mass modulation. The cC invention has osteopathic and cytostatic activity. The polynucleotides of CC the invention may have a use in gene therapy. The transgenic animals and CC uncleic acids are for the study of bone density modulation, where the CC species in more than one parameter selected from bone density, bone CC strength, trabecular number, bone size, or bone tissue connectivity. The ctransgenic animals, nucleic acids and methods are useful for identifying CC molecules involved in bone development, and for developing pharmaceutical CC compositions, which may be employed for treating or preventing bone CC diseases, e.g. osteoporosis, osteomalacia, rickete, Paget's disease, or neoplasms of the bone. The transgenic animals and nucleic acids are also useful in methods for diagnosing diseases involved in bone development, CC or characterised by reduced bone density or mass. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                      Query Match

The invention relates to novel transgenic animals expressing the high CC bone mass (HBM) gene, expressing the corresponding wild type HBM gene, comprising an alteration of the gene encoding LRP5 or LRP6, or expressing cc omprising an alteration of the gene encoding LRP5 or LRP6, or expressing can LRP5 that is modulated by an altered gene control sequence introduced by homologous or non-homologous recombination. The transgenic animals are for the study of bone density modulation or bone mass modulation. The control sequence introduced the invention has osteopathic and cytostatic activity. The polymucleotides of the invention may have a use in gene therapy. The transgenic animals and culeic acids are for the study of bone density modulation, where the bone mass is modulated relative to non-transgenic animals of the same cc species in more than one parameter selected from bone density, bone strength, trabecular number, bone size, or bone tissue connectivity. The transgenic animals, nucleic acids and methods are useful for identifying compositions, which may be employed for treating or preventing bone compositions, which may be employed for treating or preventing bone complasms of the bone. The transgenic animals and nucleic acids are also cuseful in methods for diagnosing diseases involved in bone development, or characterised by reduced bone density or mass. The present sequence is used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method for identifying a molecule involved in lipid regulation comprising identifying a molecule that binds to or inhibits binding of a molecule to high bone mass (HBM) or its wild type gene, Zmaxl. Compounds identified by the method are useful for treating, diagnosing, preventing or screening for normal and abnormal lipid-associated conditions, including arteriosclerosis, cardiovascular
                                                                                                                                                                        HBM systems can be used as surrogate markers in pharmaceutical development, in diagnosis of human or animal bone disease, and in the treatment of bone diseases. Sequences ABK22776-ABK23411 represent cDNA molecules encoding human Zmax1 and HBM, and PCR primers, probes, linker and adapters of the invention
                                                                                                                                                                                                                                                           associated conditions, including arteriosclerosis, cardiovascular disease, stroke, and osteoporosis. The compounds may also be used in the treatment or prevention of diabetic atherosclerosis, neurovascular conditions caused by plaque build-up, poor circulation due to plaque build-up, poor accountation due to plaque build-up and associated poor wound healing. The methods may be used in gene therapy, pharmaceutical development, and diagnostic assays for bone development disorders. Molecules identified by comparison of Zmax1 and development disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying molecules involved in lipid regulation, useful for diagnosing, treating or preventing e.g., arteriosclerosis, complete identifying a molecule that binds to high bone mass gene or its corresponding wild type gene.
                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ADJ78668 standard; DNA;
                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises 42 gene sequences which were found to be differentially methylated in pancreatic cancer. The DNA sequences of tinvention are useful in detecting cellular proliferative disorders in patient. The DNA sequences of the invention are useful for cancer screening, risk-assessment, prognosis, minimal-residual disease identification, staging and identification of therapeutic targets. The

                                                                                                                                                    The present invention relates to viral vectors comprising a nucleic acid sequence encoding retinoic acid receptor beta-2 (RARbeta2). The vector is preferably based on or derived from a lentivirus, more preferably nongrises deleted regions of the gag-pol genes. The vector may be engineered to replace all or part of the env gene with env sequences from other RNA viruses (e.g. gene encoding vesicular stomatitis virus gyeven;), the vottor. The viral vectors of the invention are useful in the preparation of a medicament, or in gene therapy to stimulate neurite development, or for the treatment of a neurological disorder (e.g. parkinson's disease and spinal cord injuries). The vectors are also useful for treating cancers, inflammatory disorders, ulcers, autoimmune disorders, cardiovascular disorders, ulcers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                haemophilia, liver cirrhosis, bone marrow transplantation or other transplantation complications. The vectors eliminate the need for administration of nerve growth factor (NGF) to a subject, enable neurite outgrowth to be promoted in adult neural tissue, and enable RARbeta2 to be introduced into non-dividing mammalian cells such as neuronal cells. The present sequence represents a primer used in the methods of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ABK37459 standard; DNA; 19

                                                                                                                        The invention relates to an isolated TRC8 (Translocation in Renal cancer from Chromosome 8) nucleic acid molecule, encoding a polypeptide comprising a sequence of 664 amino acids fully defined in the specification and comprising a sequence located in the 5 flanking region to the coding region of TRC8 and a sequence which occurs in certain sporadic renal cell carcinomas. The methods are useful for detecting the presence of the TRC8 gene in a biological sample, detecting alterations to the gene, such as a 3;2 human chromosomal translocation, and fused DNA containing the fused site of TRC8/FHIT. A nucleic acid probe is useful for detecting the 3;8 human chromosomal translocation, by contacting the nucleic acid probe with a biological sample to be tested, and determining whether the nucleic acid probe specifically hybridies to the TRC8/FHIT or purify/mpco services.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel Translocation in Renal cancer from Chromosome 8 genes, useful for detection of tumors, comprises rearrangements in the t(3;8) (p14.2;q24.1) chromosomal translocation which occurs in renal and thyroid carcinomas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TRC8; Translocation in Renal cancer from Chromosome 8; fused DNA; FHIT/TRC8 fusion DNA; sporadic renal cell carcinoma; TRC8/FHIT; TI human chromosomal translocation; ds.
